

I don't know how helpful it would be at this point, with this variant.

I think that so many people have already made up their minds about whether they're going to get vaccinated or not, and this variant is still getting people sick, regardless of vaccination status. The only utility I'd see this having, in concept, is reducing the number of cases that fill up hospitals. However, I don't think it would slow it down to any significant degree, especially when we seem to be approaching a peak in infection rate for the state and county.

I think more focus should be placed on marketing vaccination and testing, and creating more efficiency in the distribution processes of getting shots in arms when kids 1 or 2-years-old and up can get vaccinated.

It might be something worth putting in place for the next variant that has a high rate of transmissibility, morbidity, and mortality, but as of now, I don't see how it would be helpful. If anything, it'd create a huge political backlash.
